Feeding and Nutrition of Nonhuman Primates

Edited by ROBERT S. HARRIS
Massachusetts Institute of Technology
Cambridge, Massachusetts

Nonhuman primates have been used in increasing numbers in biomedical research during recent years. Since most of these studies extend over months and even years, questions concerning the nutritional adequacy of their diets have become of critical importance. This book is an evaluation of the current state of knowledge concerning the feeding and nutrition of nonhuman primates. It contains valuable basic information concerning the nutrient requirements of the primate species most commonly used in research. The sixteen chapters in the book present discussions of the feeding habits of primates in the wild, the selectionof primates for research, the care of newly imported animals, the general nutritional requirements of primates, malnutrition and deficiency diseases, infections and other diseases of primates which may affect nutritional requirements, and details on the formulation of natural and synthetic diets which are fully nutritious and accepted by the animals. In addition, there are detailed papers on the nutritional requirements of marmosets, baboons, and macaque, cebus, squirrel, and woolly monkeys.
